Respiratory Health

www.standardprocess.com

Most people breathe without thinking. In every breath, the lungs take in oxygen from the air so it can be distributed through the bloodstream in order to fuel all the body's cells and organs. If the lungs become saturated with toxins, they are unable to filter waste properly. Common toxins in the air are tobacco smoke, occupational fumes, air pollution, smog, and germs. Exposure to these toxins can manifest into varying health concerns. Standard Process offers a range of nutritional supplements to help the lungs naturally defend themselves against unwanted substances.

Pneumotrophin PMG[®] Bovine lung PMG™ extract contains the concentrated components from the nucleus of lung cells that are responsible for the determination of cellular function within the respiratory system. The foundation for the function of these uniquely-formulated, nucleoprotein-mineral extracts comes from the antigen-antibody reaction that takes place during normal cell maintenance. The antigenic properties promote healthy cellular division, function, and growth. The body's response occurs from the action of these antigenic proteins combining with antibodies that otherwise challenge organ and system function. The antigenic properties of these nucleoprotein-mineral molecules promote healthy cellular division, growth, repair, and function.*

Antronex[®] When presented with an environmental challenge, nearly every tissue in the body can release histamine. Maintaining your body's immune system helps keep histamine at healthy levels. Yakriton, a bovine liver fat extract discovered in the 1920s by Japanese researchers, has been shown to help maintain a healthy liver. The mechanism of action for helping to maintain healthy histamine levels in this respect is believed to occur by way of improving the blood-filtering capacity of the liver.*

Allerplex[®] The primary purpose of bovine lung PMG™ extract is to support the healthy function of the lungs and upper respiratory system. The adrenal glands support healthy respiratory function when the body is exposed to stress and emotional changes. The adrenal gland also produces cortisol, which addresses various types of environmental responses. The adrenal PMG™ extract contained in this product helps maintain the healthy functioning of the adrenal glands. Calcium is frequently effective in helping to maintain a healthy immune system. Fenugreek seed helps normalize unhealthy production of mucus.*

Emphaplex[®] Vitamin A from oat flour, carrot, beef liver, and alfalfa helps repair and maintain epithelial tissue that lines much of the respiratory tract and mucous membranes. Vitamins B₁ and B₂ from fenugreek, wheat germ, oat flour, alfalfa, and peanut bran promote healthy circulation and work together with vitamin A to maintain healthy mucous membranes. Vitamins A, C, D, and B₆ play primary roles in immune support. Vitamins A and C also provide antioxidant protection to help support and maintain the respiratory system in an environment with challenges from pollutants and free radicals. The vitamins, minerals, and glandular components found in Emphaplex are combined to maximize support for the respiratory system and maintenance of the immune system.*
